# CONTENTS

- KpqC round 2 – lattice-based schemes
- Improved Meet-LWE Attack via Ternary Trees (reported on 06/14/2024 at KpqC Bulletin)
  - Backgrounds
  - Our Idea to Generalize and Improve the Meet-LWE Attack
  - Complexity Results
- Minor comments for the security proof of NTRU+
- Security Evaluation of {LWE, LWR}-based schemes Using Lattice Estimator
- Summary

## KPQC ROUND 2 –LATTICE-BASED SCHEMES

- Among Round 1 candidates, 3 KEMs and 5 signatures were lattice-based schemes.
- 2 KEMs and 2 signatures are selected as Round 2 candidates

**Abstract.** The Learning with Errors (LWE) problem with its variants over structured lattices has been widely exploited in efficient post-quantum cryptosystems. Recently, May [59] suggests the Meet-LWE attack, which poses a significant advancement in the line of work on the Meet-in-the-Middle approach to analyze LWE with ternary secrets. In this work, we generalize and extend the idea of Meet-LWE by introducing ternary trees, which result in diverse representations of the secrets. More precisely, we split the secrets into three pieces with the same dimension and expand them into a ternary tree to leverage the increased representations to improve the overall attack complexity. We also suggest the matching criteria for the approximate matching of three lists via locality sensitive hash function accordingly. We carefully analyze and optimize the time and memory costs of our attack algorithm exploiting ternary trees, and compare them to those of the Meet-LWE attack. With asymptotic and non-asymptotic comparisons, we observe that our attack provides improved estimations for all parameter settings, including those of the practical post-quantum schemes, compared to the Meet-LWE attack. We also evaluate the security of the Round 2 candidates of the KpqC competition which aims to standardize post-quantum public key cryptosystems in the Republic of Korea and report that the estimated complexities for our attack applied to SMAUG-T are lower than the claimed for some of the recommended parameters.

**Keywords:** Learning with Errors, Meet-LWE, Meet-in-the-Middle, KpqC Competition

# IMPROVED MEET-LWE ATTACK VIA TERNARY TREES

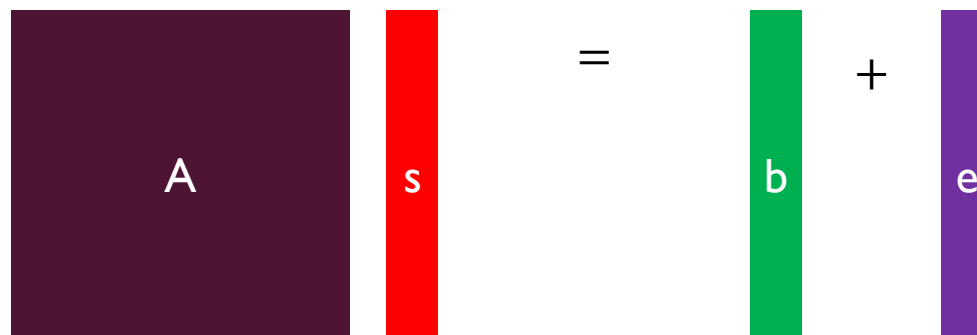

LEE, EUNMIN, JOOHEE LEE, YONGHA SON, AND YUNTAO WANG. "IMPROVED MEET-LWE ATTACK VIA TERNARY TREES." *CRYPTOLOGY EPRINT ARCHIVE* (2024).

# TERNARY LWE PROBLEM

## [Ternary LWE problem]

Given;  $A \in \mathbb{Z}_q^{n \times n}, b \in \mathbb{Z}_q^n$  such that  $A \cdot s = b + e$  for  $s, e \in \{0, \pm 1\}^n$ ,

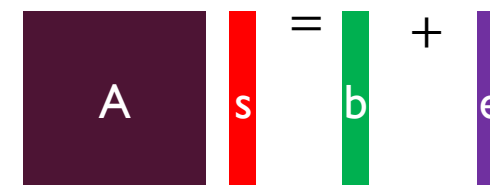

Find;  $s \in \{0, \pm 1\}^n$

$$A \cdot s = b + e$$

- Asymptotically, Brute Force < Odlyzko's MitM < Meet-LWE < Ours
- Meet-LWE and our attack are applicable to all KpqC Round 2 Lattice-based KEMs
  - SMAUG-T uses sparse secrets
  - NTRU+ uses the ternary LWE problem

# BRUTE FORCE ATTACK FOR TERNARY LWE

- Equation :  $A \cdot s = b + e \text{ mod } q$

$$A \cdot s = b + e$$

## [Brute Force]

- Input :  $A \in Z_q^{n \times n}, b \in Z_q^n$
- For all  $s \in \{0, \pm 1\}^n$ :
  - If  $A \cdot s - b \in \{0, \pm 1\}^n$  then output  $s$

- $S = 3^n$ ; search space size for ternary keys
- Running time is  $T = S$

# ODLYZKO'S MITM

- Equation :  $A_1 \cdot s_1 = -A_2 \cdot s_2 + b + e \mod q$

i.e.  $A_1 \cdot s_1 \approx -A_2 \cdot s_2 + b \mod q$

## [Odlyzko's MitM]

- Input :  $A = (A_1|A_2) \in \mathbb{Z}_q^{n \times n}, b \in \mathbb{Z}_q^n$
- For all  $s_1 \in \{0, \pm 1\}^{n/2}$ :
  - Construct  $L_1$  with entries  $(s_1, h(A_1 s_1))$
- For all  $s_2 \in \{0, \pm 1\}^{n/2}$ :
  - Construct  $L_2$  with entries  $(s_2, h(-A_2 s_2 + b))$
- Output  $(s_1|s_2)$  with  $h(A_1 s_1) = h(-A_2 s_2 + b)$

\*  $h$ : locality sensitive hash

- $S = 3^n$ ; search space size for ternary keys
- Running time is  $T = 3^{n/2} = S^{1/2}$  with same memory

# REPRESENTATIONS (HOWGRAVE-GRAHAM, JOUX '10)

- **Idea** ;  $s := s_1 + s_2$  for  $s_1, s_2 \in \{0, \pm 1\}^n$

- Allows redundancy

$$\begin{array}{|c|c|} \hline A & s_1 \\ \hline \end{array} + \begin{array}{|c|c|} \hline A & s_2 \\ \hline \end{array} = \begin{array}{|c|} \hline b \\ \hline \end{array} + \begin{array}{|c|} \hline e \\ \hline \end{array}$$

- $(1, 0, 1, -1, 0) = (1, 0, 0, -1, 0) + (0, 0, 1, 0, 0)$

$$= (1, 0, 1, 0, 0) + (0, 0, 0, -1, 0)$$

$$= (0, 0, 1, 0, 0) + (1, 0, 0, -1, 0)$$

$$= (0, 0, 1, -1, 0) + (1, 0, 0, 0, 0)$$

	1		0		-1	
REP-0	• 1+0		-		• (-1)+0	
	• 0+1				• 0+(-1)	
REP-1	• 1+0		• 1+(-1)		• (-1)+0	
	• 0+1		• (-1)+1		• 0+(-1)	
REP-2	• 1+0	• 2+(-1)	• 1+(-1)	• 2+(-2)	• (-1)+0	• 1+(-2)

# MEET LWE ATTACK [MAY21]

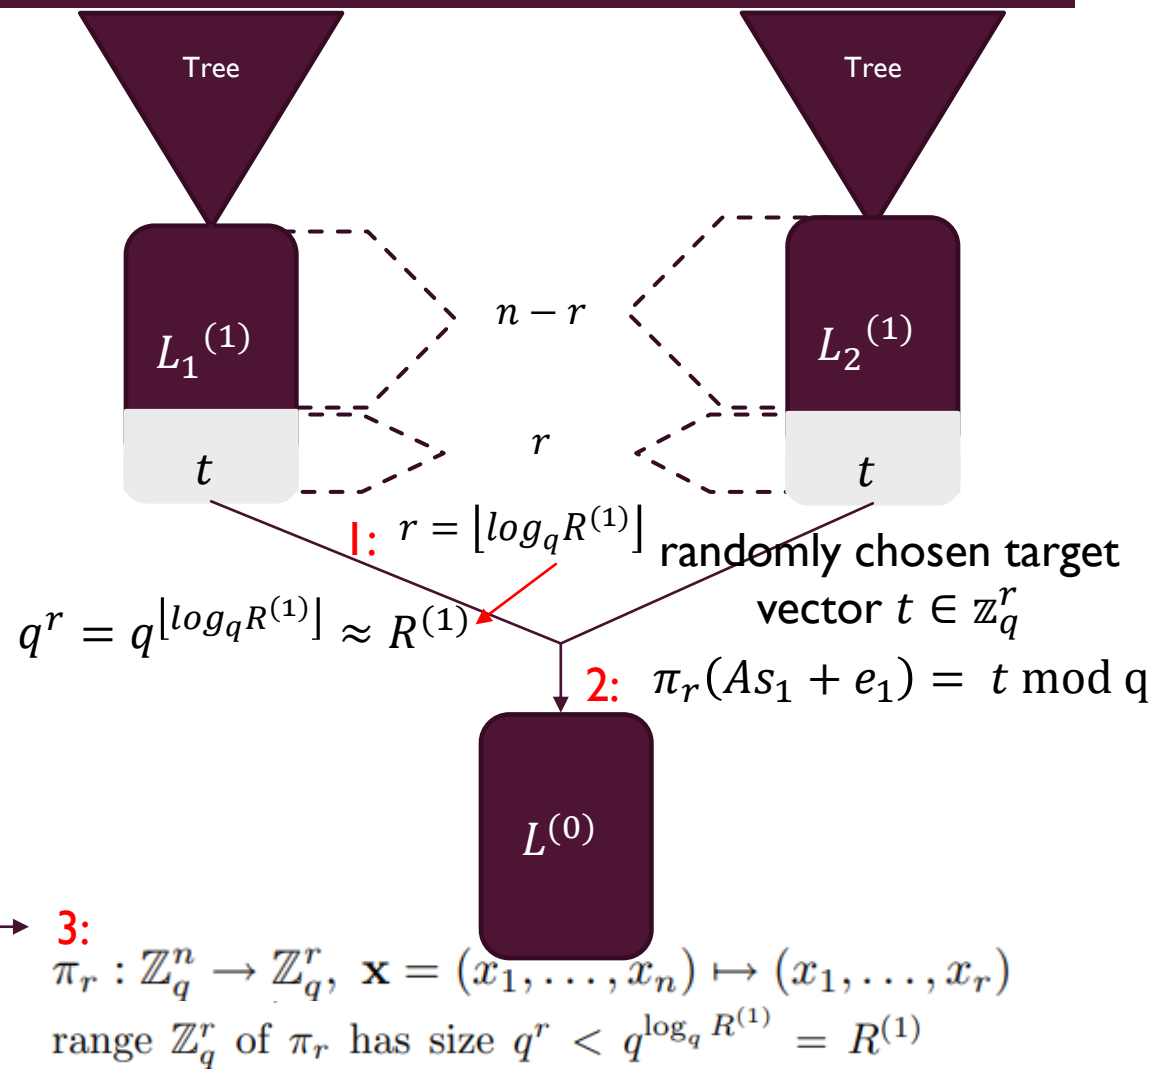

$$\begin{array}{|c|c|} \hline A & s_1 \\ \hline \end{array} + \begin{array}{|c|c|} \hline A & s_2 \\ \hline \end{array} = \begin{array}{|c|} \hline b \\ \hline \end{array} + \begin{array}{|c|} \hline e \\ \hline \end{array}$$

$e = e_2 - e_1$

- Equation:  $A_1 \cdot s_1 = -A_2 \cdot s_2 + b + e \mod q$   
i.e.  $A_1 \cdot s_1 \approx -A_2 \cdot s_2 + b \mod q$

## [Meet LWE (high-level idea)]

- Input:  $A \in \mathbb{Z}_q^{n \times n}, b \in \mathbb{Z}_q^n$
- Choose representation REP-0, REP-1, REP-2
- Guess  $r$  coordinates of  $e$**  (say  $\underline{t}$ )
- For  $s_1$ , construct  $L_1$  with entries  $(s_1, h(As_1))$
- For  $s_2$ , construct  $L_2$  with entries  $(s_2, h(-As_2 + b))$
- Output  $s_1 + s_2$  s.t.
  - $\pi_r(As_1 + e_1) = t = \pi_r(-As_2 + b + e_2)$
  - $h(As_1) = h(-As_2 + b)$  for  $n - r$  coordinates

# MEET LWE ATTACK [MAY21]

- By using representations  $s = s_1 + s_2$ , **the number of solutions ( $:= R$ ) increases**
- We can **reduce the list ( $L_1, L_2$ ) sizes with a factor of  $R$**  (by guessing  $r$  coordinates of  $e$ ), expecting at least one solution exists
  - This strategy can be recursively applied to  $s_1, s_2$ , respectively (lists can be obtained by tree-based construction)
- Run-time  $T = T_g \cdot T_\ell$  where  $T_g$ ; guessing complexity,  $T_\ell$ ; list construction complexity

REP-1-0	<ul style="list-style-type: none"> <li>• 1+0+0</li> <li>• 0+1+0</li> <li>• 0+0+1</li> </ul>		<ul style="list-style-type: none"> <li>• 0+1+(-1)</li> <li>• 0+(-1)+1</li> <li>• 1+0+(-1)</li> </ul>	<ul style="list-style-type: none"> <li>• 1+(-1)+0</li> <li>• (-1)+0+1</li> <li>• (-1)+1+0</li> </ul>	<ul style="list-style-type: none"> <li>• (-1)+0+0</li> <li>• 0+(-1)+0</li> <li>• 0+0+(-1)</li> </ul>	
REP-1-1	<ul style="list-style-type: none"> <li>• 1+0+0</li> <li>• 0+1+0</li> <li>• 0+0+1</li> </ul>	<ul style="list-style-type: none"> <li>• 1+1+(-1)</li> <li>• (-1)+1+1</li> <li>• 1+(-1)+1</li> </ul>	<ul style="list-style-type: none"> <li>• 0+1+(-1)</li> <li>• 0+(-1)+1</li> <li>• 1+0+(-1)</li> </ul>	<ul style="list-style-type: none"> <li>• 1+(-1)+0</li> <li>• (-1)+0+1</li> <li>• (-1)+1+0</li> </ul>	<ul style="list-style-type: none"> <li>• (-1)+0+0</li> <li>• 0+(-1)+0</li> <li>• 0+0+(-1)</li> </ul>	<ul style="list-style-type: none"> <li>• (-1)+1+(-1)</li> <li>• (-1)+(-1)+1</li> <li>• 1+(-1)+(-1)</li> </ul>

# OUR IDEA

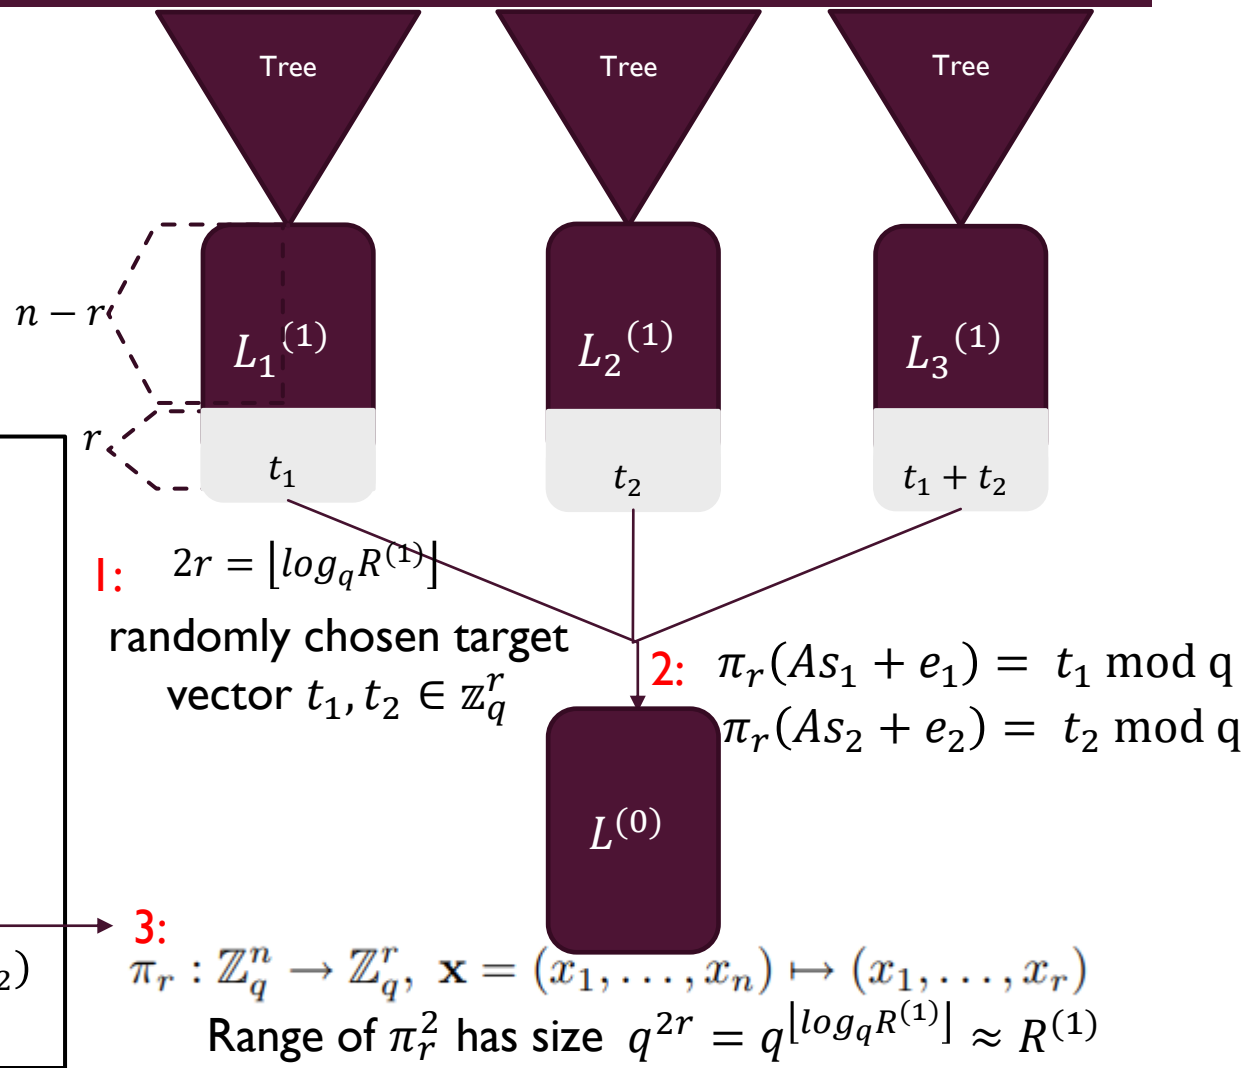

$$\begin{array}{|c|c|} \hline A & s_1 \\ \hline \end{array} + \begin{array}{|c|c|} \hline A & s_2 \\ \hline \end{array} + \begin{array}{|c|c|} \hline A & s_3 \\ \hline \end{array} = \begin{array}{|c|} \hline b \\ \hline \end{array} + \begin{array}{|c|} \hline e \\ \hline \end{array}$$

$e = e_3 - e_1 - e_2$

- Equation:  $A_1 \cdot s_1 + A_2 \cdot s_2 = -A_3 \cdot s_3 + b + e \mod q$   
i.e.  $A_1 \cdot s_1 + A_2 \cdot s_2 \approx -A_3 \cdot s_3 + b \mod q$

## [Extended Meet-LWE Attack (high-level idea)]

- Input :  $A \in \mathbb{Z}_q^{n \times n}, b \in \mathbb{Z}_q^n$
- Choose representation REP-0, REP-I-0, REP-I-I
- Guess  $r$  coordinates of  $e_1, e_2$  (say  $t_1, t_2$ )
- For  $s_1$ , construct  $L_1$  with entries  $(s_1, h(As_1))$
- For  $s_2$ , construct  $L_2$  with entries  $(s_2, h(As_2))$
- For  $s_3$ , construct  $L_3$  with entries  $(s_3, h(b - As_3))$
- Output  $s_1 + s_2 + s_3$  s.t.
  - $\pi_r(As_1 + e_1) = t_1, \pi_r(As_2 + e_2) = t_2$
  - $\pi_r(-As_3 + b + e_3) = t_1 + t_2 = \pi_r(As_1 + e_1) + \pi_r(As_2 + e_2)$
  - $h(As_1) \oplus h(As_2) = h(-As_3 + b)$  for  $n - r$  coordinates

# OUR IDEA

$$\begin{matrix} \boxed{A} & \boxed{s_1} & + & \boxed{A} & \boxed{s_2} & + & \boxed{A} & \boxed{s_3} & = & \boxed{b} & + & \boxed{e} \end{matrix}$$

$e = e_3 - e_1 - e_2$

- Equation:  $A_1 \cdot s_1 + A_2 \cdot s_2 = -A_3 \cdot s_3 + b + e \mod q$   
i.e.  $A_1 \cdot s_1 + A_2 \cdot s_2 \approx -A_3 \cdot s_3 + b \mod q$

## [Extended Meet-LWE Attack (high-level idea)]

- Input :  $A \in \mathbb{Z}_q^{n \times n}, b \in \mathbb{Z}_q^n$
- Choose representation REP-0, REP-I-0, REP-I-I
- Guess  $r$  coordinates of  $e_1, e_2$**  (say  $t_1, t_2$ )
- For  $s_1$ , construct  $L_1$  with entries  $(s_1, h(As_1))$
- For  $s_2$ , construct  $L_2$  with entries  $(s_2, h(As_2))$
- For  $s_3$ , construct  $L_3$  with entries  $(s_3, h(b - As_3))$
- Output  $s_1 + s_2 + s_3$  s.t.
  - $\pi_r(As_1 + e_1) = t_1, \pi_r(As_2 + e_2) = t_2$
  - $\pi_r(-As_3 + b + e_3) = t_1 + t_2 = \pi_r(As_1 + e_1) + \pi_r(As_2 + e_2)$
  - $h(As_1) \oplus h(As_2) = h(-As_3 + b)$  for  $n - r$  coordinates

**Problem: LSH is not additively homomorphic!**

# OUR IDEA

$$\begin{array}{|c|c|} \hline A & s_1 \\ \hline \end{array} + \begin{array}{|c|c|} \hline A & s_2 \\ \hline \end{array} + \begin{array}{|c|c|} \hline A & s_3 \\ \hline \end{array} = \begin{array}{|c|} \hline b \\ \hline \end{array} + \begin{array}{|c|} \hline e \\ \hline \end{array}$$

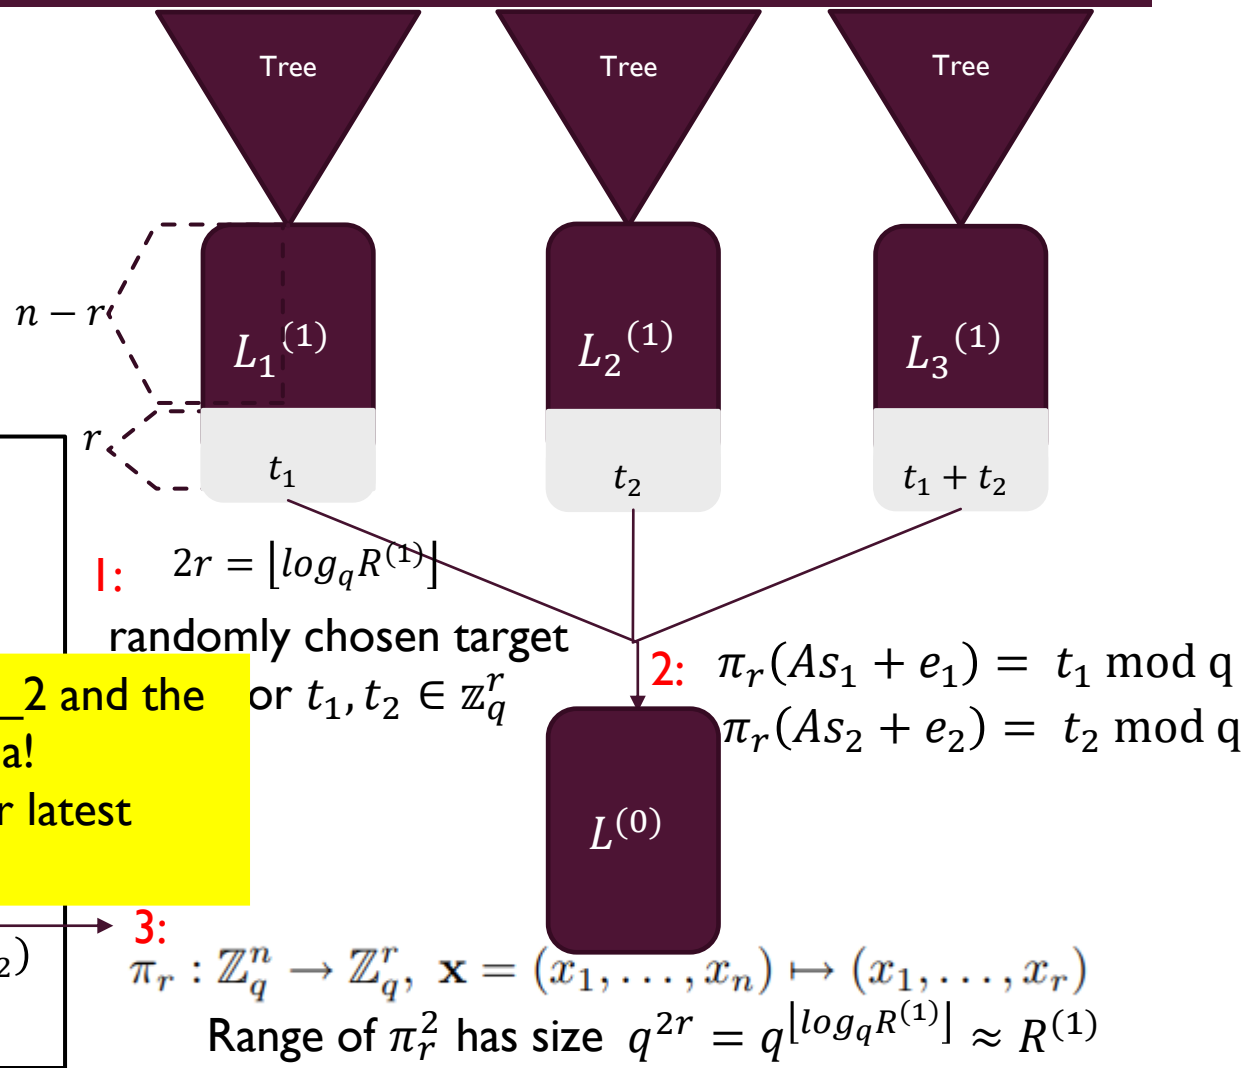

$e = e_3 - e_1 - e_2$

- Equation:  $A_1 \cdot s_1 + A_2 \cdot s_2 = -A_3 \cdot s_3 + b + e \mod q$   
i.e.  $A_1 \cdot s_1 + A_2 \cdot s_2 \approx -A_3 \cdot s_3 + b \mod q$

## [Extended Meet-LWE Attack (high-level idea)]

- Input :  $A \in \mathbb{Z}_q^{n \times n}, b \in \mathbb{Z}_q^n$
- Choose representation REP-0, REP-I-0, REP-I-I
- Guess  $r$  coordinates of  $e_1, e_2$  (say  $t_1, t_2$ )
- For  $s_1$ , construct  $L_1$  with entries  $(s_1, As_1)$
- For  $s_2$ , construct  $L_2$  with entries  $(s_2, As_2)$
- For  $s_3$ , construct  $L_3$  with entries  $(s_3, h(b - As_3))$
- Output  $s_1 + s_2 + s_3$  s.t.
  - $\pi_r(As_1 + e_1) = t_1, \pi_r(As_2 + e_2) = t_2$
  - $\pi_r(-As_3 + b + e_3) = t_1 + t_2 = \pi_r(As_1 + e_1) + \pi_r(As_2 + e_2)$
  - $h(As_1 + As_2) = h(-As_3 + b)$  for  $n - r$  coordinates

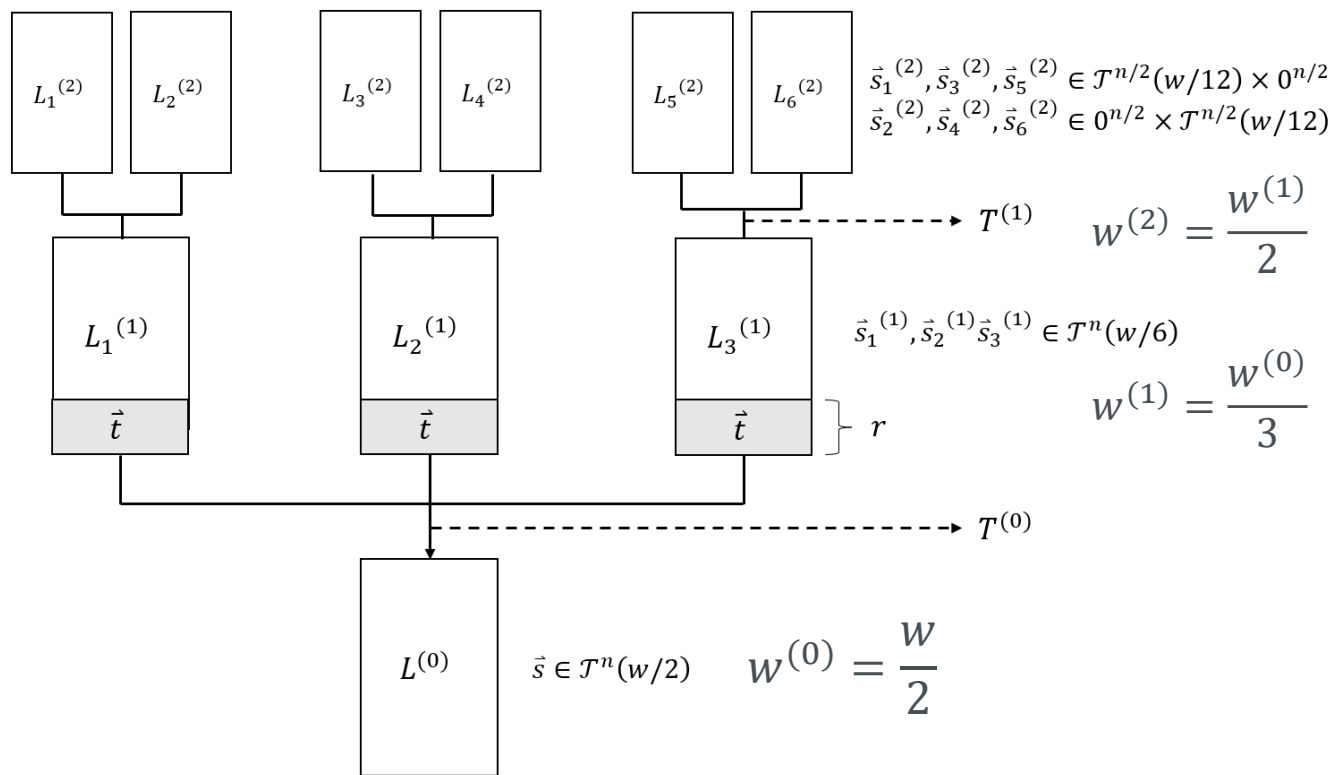

Changed  $L_1, L_2$  and the matching criteria!  
(reflected in our latest eprint version)

## OUR IDEA

- By using ternary representations  $s = s_1 + s_2 + s_3$ , **the number of solutions ( $:= R$ ) even more increases**
  - We can **also reduce the list  $(L_1, L_2, L_3)$  sizes with a factor of this increased  $R$**  (by guessing  $r$  coordinates of  $e$ ), expecting at least one solution exists
  - $r \approx \frac{1}{2} \cdot \log_q R$  rather than  $r \approx \log_q R$  in the original Meet-LWE ; note that  $r$  determines guessing complexity
- Putting all these together, the extended Meet-LWE via ternary tree shows lower complexity than the that of the Meet-LWE attack.

[May]: REP-2 vs. [Ours]: REP-I

- The claimed security using the 'beyond core-SVP' from SMAUG-T document were **135.3** bits, 144.7 bits, **202.0** bits, and **274.6** bits, respectively.
- For TiMER, SMAUG-T192, and SMAUG-T256 parameters, the estimated attack complexities are lower in security by **13.3** bits, **20** bits, and **43.6** bits than claimed.

# MINOR COMMENTS FOR THE SECURITY PROOF OF NTRU+ (ROUND 2 DOCUMENT VERSION)

# SUMMARY ON NTRU+ KEM

- Security based on the **NTRU**, **RLWE** assumptions
  - RLWE here uses (random) binary secrets and ternary errors
- Uses **NTT-friendly rings**
  - $R_q = \mathbb{Z}_q[x]/(f(x))$ , where  $f(x) = x^n - x^{n/2} + 1$  and  $n = 2^i 3^j$  [1,2]
- Uses a new encoding named **SOTP** (Semi-generalized One Time Pad)
- In the CCA-secure KEM, they **remove re-encryption** in decapsulation by adjusting Fujisaki-Okamoto transform

# COMMENTS FOR THE SECURITY PROOF

[FO transform without Re-Encryption (Lemma 4.3)]

- To show: For input ciphertext  $c$ ,

$c = \text{Enc}'(pk, m'; R')$  if and only if  $r' = r''$

- $(\rightarrow)$  Assume  $c = \text{Enc}'(pk, m'; R')$  in Decaps.

By the definition of  $\text{Enc}'$ ,  $c = \text{Enc}(pk, \text{SOTP}(m', G(r''))); r''$  holds where  $r'' \leftarrow \psi_R$  is sampled using  $R'$

Also, since  $M' = \text{Dec}(sk, c) \in \mathcal{M}$  and  $r' = \text{RRec}(pk, M', c) \in \mathcal{R}$ , the rigidity of the PKE leads to  $c = \text{Enc}(pk, M'; r')$ .

⋮

```
Decap(sk, c)
1: M' = Dec(sk, c)
2: r' = RRec(pk, M', c)
3: m' = Inv(M', G(r'))
4: (R', K') := H(m')
5: if m' = ⊥ or r' ∉ R or c ≠ Enc'(pk, m'; R')
6:   return ⊥
7: else
8:   return K'
```

Figure 11: Modified KEM =  $\text{FO}_{\text{KEM}}^\perp[\text{PKE}', H]$

```
Decap(sk, c)
1: M' = Dec(sk, c)
2: r' = RRec(pk, M', c)
3: m' = Inv(M', G(r'))
4: (R', K') := H(m')
5: r'' ← ψ_R with the randomness R'
6: if m' = ⊥ or r' ≠ r''
7:   return ⊥
8: else
9:   return K'
```

# COMMENTS FOR THE SECURITY PROOF

[FO transform without Re-Encryption (Lemma 4.3)]

- To show: For input ciphertext  $c$ ,

$$c = \text{Enc}'(pk, m'; R') \text{ if and only if } r' = r''$$

- $(\rightarrow)$  Assume  $c = \text{Enc}'(pk, m'; R')$  in Decaps.

By the definition of  $\text{Enc}'$ ,  $c = \text{Enc}(pk, \text{SOTP}(m', G(r''))); r''$  holds where  $r'' \leftarrow \psi_R$  is sampled using  $R'$

Also, since  $M' = \text{Dec}(sk, c) \in \mathcal{M}$  and  $r' = \text{RRec}(pk, M', c) \in \mathcal{R}$ , the rigidity of the PKE leads to

$$c = \text{Enc}(pk, M'; r').$$

⋮

Decap( $sk, c$ )

```

1:  $M' = \text{Dec}(sk, c)$ 
2:  $r' = \text{RRec}(pk, M', c)$ 
3:  $m' = \text{Inv}(M', G(r'))$ 
4:  $(R', K') := H(m')$ 
5: if  $m' = \perp$  or  $r' \notin \mathcal{R}$  or  $c \neq \text{Enc}'(pk, m'; R')$ 
6:   return  $\perp$ 
7: else
8:   return  $K'$ 
```

Figure 11: Modified KEM =  $\text{FO}_{\text{KEM}}^\perp[\text{PKE}', H]$

Decap( $sk, c$ )

```

1:  $M' = \text{Dec}(sk, c)$ 
2:  $r' = \text{RRec}(pk, M', c)$ 
3:  $m' = \text{Inv}(M', G(r'))$ 
4:  $(R', K') := H(m')$ 
5:  $r'' \leftarrow \psi_{\mathcal{R}}$  with the randomness  $R'$ 
6: if  $m' = \perp$  or  $r' \neq r''$ 
7:   return  $\perp$ 
8: else
9:   return  $K'$ 
```

Figure 12: KEM =  $\overline{\text{FO}}_{\text{KEM}}^\perp[\text{PKE}', H]$

**Rigidity.** Under the assumption that PKE is RR, we say that PKE is  $\delta$ -rigid if for all  $(pk, sk) \leftarrow \text{Gen}(1^\lambda)$  and  $c \in \mathcal{C}$ , we have

$$\Pr [\text{Enc}(pk, m'; r') \neq c | m' = \text{Dec}(sk, c) \in \mathcal{M} \wedge r' = \text{RRec}(pk, m', c) \in \mathcal{R}] \leq \delta.$$

# COMMENTS FOR THE SECURITY PROOF

[FO transform without Re-Encryption (Lemma 4.3)]

- To show: For input ciphertext  $c$ ,

$$c = \text{Enc}'(pk, m'; R') \text{ if and only if } r' = r''$$

- ( $\rightarrow$ ) Assume  $c = \text{Enc}'(pk, m'; R')$  in Decaps.

By the definition of  $\text{Enc}'$ ,  $c = \text{Enc}(pk, \text{SOTP}(m', G(r''))); r''$  holds where  $r'' \leftarrow \psi_R$  is sampled using  $R'$

Also, since  $M' = \text{Dec}(sk, c) \in \mathcal{M}$  and  $r' = \text{RRec}(pk, M', c) \in \mathcal{R}$ , the rigidity of the PKE leads to

$$c = \text{Enc}(pk, M'; r').$$

⋮

They assumed that, for  $c$  (input of Decaps),  $M' = \text{Dec}(sk, c) \in \mathcal{M}$  and  $r' = \text{RRec}(pk, M', c) \in \mathcal{R}$ .  
But, there is no guarantee for that.

```
Decap(sk, c)
1: M' = Dec(sk, c)
2: r' = RRec(pk, M', c)
3: m' = Inv(M', G(r'))
4: (R', K') := H(m')
5: if m' = ⊥ or r' ∉ R or c ≠ Enc'(pk, m'; R')
6:   return ⊥
7: else
8:   return K'
```

Figure 11: Modified KEM =  $\text{FO}_{\text{KEM}}^\perp[\text{PKE}', H]$

Decap(sk, c)
1: M' = Dec(sk, c)
2: r' = RRec(pk, M', c)
3: m' = Inv(M', G(r'))
4: (R', K') := H(m')
5: r'' ← ψ_R with the randomness R'
6: if m' = ⊥ or r' ≠ r''
7:   return ⊥
8: else
9:   return K'
```

Figure 12: KEM =  $\overline{\text{FO}}_{\text{KEM}}^\perp[\text{PKE}', H]$

**Rigidity.** Under the assumption that PKE is RR, we say that PKE is  $\delta$ -rigid if for all  $(pk, sk) \leftarrow \text{Gen}(1^\lambda)$  and  $c \in \mathcal{C}$ , we have

$$\Pr [\text{Enc}(pk, m'; r') \neq c | m' = \text{Dec}(sk, c) \in \mathcal{M} \wedge r' = \text{RRec}(pk, m', c) \in \mathcal{R}] \leq \delta.$$

# SECURITY EVALUATION OF {LWE, LWR}-BASED SCHEMES USING LATTICE ESTIMATOR

- [Lattice Estimator — Lattice Estimator 0.1 documentation \(lattice-estimator.readthedocs.io\)](https://lattice-estimator.readthedocs.io)
- Albrecht, Martin R., Rachel Player, and Sam Scott. "On the concrete hardness of learning with errors." *Journal of Mathematical Cryptology* 9.3 (2015): 169-203.

# GOAL

- Better understanding for the security estimation of KpqC Round 2 candidates
  - Analysis reports for the respective attacks
- Estimate the security for all the LWE/LWR based schemes {NTRU+, SMAUG-T, HAETAE, NCC-Sign}

# METHODS

- **Lattice estimator**

- For LWE/LWR security analysis, M. Albrecht's Lattice Estimator ([Lattice Estimator — Lattice Estimator 0.1 documentation \(lattice-estimator.readthedocs.io\)](https://lattice-estimator.readthedocs.io)) is used. Lattice Estimator is a Sage open source that calculates the attack complexities and additional parameters required for attack by taking LWE/LWR parameters as input values.

- **The BKZ Algorithm Complexity – Core-SVP model**

- The principle of the BKZ algorithm is to repeatedly apply the SVP solver, an algorithm that finds the shortest vector, for a sub-lattice of dimension ( $\beta$ ) smaller than that of a given lattice.
- The Core-SVP model from the NewHope paper (USENIX'16) is a model for estimating the time complexity of the BKZ algorithm. The classical security in bits is estimated as  $2^{c \cdot \beta}$  using  $c = 0.292$ , and the quantum security (bit) can be also estimated by calculating the classical security (bit)  $\times c_q/0.292$  in the Core-SVP model.

	Classical	Quantum[1]
$c$	0.292	0.257
$T$	$2^{0.292\beta}$	$2^{0.257\beta}$

[1] Chailloux, A., Loyer, J. Lattice Sieving via Quantum Random Walks. ASIACRYPT 2021

# RESULTS - KEMS

- Estimated security for SMAUG-T ; 7.5~13.2 bits lower than claimed for security category 1 and 3
- Estimated security for NTRU+ ; 3.1~14.3 bits lower than claimed

# RESULTS - SIGNATURES

- Estimated security for HAETAE ; 7~17.8 bits lower than claimed

# RESULTS - SIGNATURES

- Estimated security for NCC-Sign ; 3.7~21.4 bits lower than claimed

# SUMMARY

- We generalize the Meet LWE attack via ternary trees which implies
  - Increased diversity of representations and
  - Decreased guessing complexity
- By analyzing and optimizing the attack complexities, we show that our approach gives better time complexity in the regime of practical parameters compared to May.
- For SMAUG-T, by exploiting the sparsity of the LWE secrets, we achieve the reduced attack complexity estimation for parameters {TiMER, SMAUGT192, SMAUGT256}.
  - the estimated attack complexities are lower in security by **13.3** bits, **20** bits, and **43.6** bits than claimed, respectively.
- For NTRU+, we point out some (minor) bugs in the security proof.
- Additionally, we report the discrepancies between estimated and claimed security bits, when estimating the security of each scheme using the Albrecht's lattice estimator.
